home from the garden represents her carrying capacity. These are the technical problems. They are not inherently formidable, except in terms of the traditional sexual division of labor of the Cubeo. The men who make the original clearing can call upon group labor and they have the spare time. If increase in manioc cultivation were only a matter of preparing a clearing it would be relatively easy for any community to double its present zone of planting. The Cubeo, however, must calculate the size of a clearing in accordance with how much land the women of a household, working independently, can cultivate. On her part, the woman does not cultivate more than she can handle in the course of her accustomed routine. In manioc cultivation each household is autonomous; and while a woman can call upon the help of another woman when she is not well there is simply no collective or cooperative organization to help harvest, bring in, and process the crop. The headman who has the authority to direct the masculine work party that prepares the clearing has no jurisdiction over the work of the women. And neither does anyone else.

Nor does the nature of demand place much pressure upon manioc production. Under ideal conditions at least two-thirds of the manioc crop is for food. The rest is divided between chicha and farinha. Since the Cubeo are moderate eaters and do not have the custom of feasting outsiders, the demand for manioc as food is inelastic. There is only a little more elasticity in the demand for chicha. Although the drinking party is a principal means for binding the sibs it cannot be said that increasing the quantity of chicha consumed at a party or adding to the traditional number of parties would promote additional sib cohesiveness. In this instance a law of diminishing returns may be said to operate.[2] In any case, since each sib assumes some of the responsibility for entertaining the others, the burden of supplying the chicha is phratry-wide. The poorer sibs entertain less often than do the richer ones.

It is in the production of farinha that some elasticity in demand may be expected. Farinha, as the Cubeo equivalent of a "cash crop," pays largely for vanity articles, ornaments that have no traditional sanction, but also for cloth petticoats, that have now become customary apparel. However, this aspect of production for the market is also socialized. The goods a woman acquires from the sale of her farinha are largely committed to the intricate network of gift exchanges that apply between husband and wife, brother and sister, and between ceremonial friends of opposite sex. In a general way

[2] See the chapter on the drinking party.

the production of farinha by women is a partial counterpart to the work of the men in the rubber forest. The man takes most of his earnings in "capital goods," muzzle-loading guns, machetes, fishhooks, matches, knives, thread, needles, ammunition. The remainder goes to a few vanity items for himself and in gifts for his wife, sister, and female ceremonial friend. It is these gifts that a woman is obligated to reciprocate through her farinha trade. Since these gift exchanges involve traditional relations of status equality they quickly achieve a relatively stable equilibrium. Only a small part, then, of commercial exchange leaves the traditional channels of lateral circulation of goods. As for "vanity" purchases, they form no part of any institutionalized expression of social prestige. The issue for the Cubeo is rather one of a limited degree of self-indulgence. For a woman, in particular, the privilege of indulging a fancy for some trinket and freely contracting her farinha for it is an essential part of her sense of domestic well-being. It is an expression, on the one hand, of her autonomy, and, on the other, of domestic felicity. A dissatisfied wife does not indulge her personal vanity more; on the contrary, she produces less.

Another important element in production is the attitude toward labor. For the Cubeo all effort must be inherently satisfying. Women accept more drudgery than do men, but they no more than the men would accept the bitter peasant philosophy that hard and unrewarding work is man's lot. Men and women alike are accustomed to a variety of effort. They do not care to drive themselves beyond the onset of boredom or of fatigue. All work patterns are based upon short and diversified rhythms. I have demonstrated this in the work cycle of women. It is even more marked in the work cycle of men. Food gathering and preparing does demand continuity and completion. The hunter must complete his chase, the fisherman must return home with a suitable catch, and the housewife must complete her daily ration of manioc cake. Even so, there are many opportunities for rest and diversion that the Indians take. They would rather eat less than work more. In the course of a year there are many holidays. Among the *Bahúkiwa* these averaged almost one a week. On the occasion of a drinking party women do not go into the fields either on the day of preparation or on the day after. In manufactures, which form part of the domestic economy, the pace of work is very slow. Men, who make the baskets that are important home utensils as well as major items in trade, work very sporadically. There is no compulsion to finish something quickly. Thus, on the whole, the Cubeo work habits also contribute to general economic inelasticity.

and wife, is based upon complementarity. Complementarity of necessity entails more precisely structured relationships than does a homologous relationship as prevails particularly among brothers, the importance of seniority notwithstanding.

Among the Cubeo, the brother-sister relationship is modeled rather closely upon the husband-wife relationship, particularly in respect to forms of economic reciprocity. Even in sexual respects there appears to be a quasi-conjugal relationship. The conjugal division of labor is that a man clears a garden and his wife cultivates it. He provides fish and game, she provides the staple, manioc. She brings in forest products that can be gathered, such as grubs, ants, wild fruits, and he supplements it further by such extra cultivations as pupunha, sugar cane, squash, gourd, coca, tobacco, and *mihi*. She makes pottery and he basketry. Under more modern conditions the women secure trade goods from the whites by bartering farinha, while the men barter their labor in the rubber forest for trade goods. The women acquire, in the main, trade goods for themselves, but will always barter something for a husband, son, or brother. Similarly, a man works primarily for his own wants, such as a muzzle-loading shotgun, but will always take part of his wages in goods for his wife, daughter, or sister.

To carry this account of sexual economic complementarity further, we might add that the women prepare all the regular everyday meals while the men take over the food preparation – with the assistance of the women – for the great events when big game (e.g., tapir) or a spectacular catch of fish has been brought in. In ceremonial life it is the role of the men to astonish the women with the mysteries of the ancestor cult and the role of the women to be astonished. One of the functions of ceremonies that maintain mystery between the sexes is to augment the tension of complementarity.

Sexual complementarity is an aspect of adult status. The young are attached to generalized groups only, the boys in a young male pack that attaches itself only loosely to the adult males, while the little girls are charged with household chores under the direction of their mothers. Adult status is reached by a woman when she has a manioc garden of her own, by a man when a woman is cultivating particularly for him. From this point of view, full adult status is gained only at marriage. The Cubeo brother-sister relationship provides for adult status in advance of marriage and, as we shall see, serves to facilitate marriage and often to protect the stability of marriages. Above all, the brother-sister relationship seems to satisfy a very strong need for particularized relationships.
